LIFE WITHOUT PAROLE SENTENCING IN NORTH CAROLINA

ABSTRACT

What explains the puzzle of life without parole (LWOP) sentencing in the United States? In the past two decades, LWOP sentences have reached record highs, with over 50,000 prisoners serving LWOP. Yet during this same period, homicide rates have steadily declined. The U.S. Supreme Court has limited the use of juvenile LWOP in Eighth Amendment rulings. Further, death sentences have steeply declined, reaching record lows. Although research has examined drivers of incarceration patterns for certain sentences, there has been little research on LWOP imposition. To shed light on what might explain the sudden rise of LWOP, we examine characteristics of the more than 1,627 cases in which LWOP was imposed from 1995 to 2017, in North Carolina, one of the states that imposes the largest numbers of these sentences. We begin by analyzing defendant race, crime, and sentence patterns by county. We associate LWOP with homicide rates, and examine interactions between homicide, victim race, and prior LWOP sentencing. This first empirical analysis of adult LWOP sentences finds important local variations in its imposition. We find that as the homicide rate increases within a county, we observe fewer LWOP sentences. We find that fewer LWOP sentences are predicted to occur as the number of black victim homicides increase in a county, but no such relationship is found when considering the number of white victim homicides. Finally, we find a strong path dependency and concentration of LWOP sentences in counties, where counties that have imposed LWOP sentences in the past are more likely to continue to do so. These findings have implications for efforts to reconsider the most severe sentences in the U.S., and they suggest that prosecutorial discretion in seeking long sentences will be important subjects for future research and policy.

LIFE WITHOUT PAROLE SENTENCING IN NORTH CAROLINA

INTRODUCTION

Life without parole (LWOP) sentencing confounds the broad trends in both crime and sentencing in the United States. During the last two decades, homicides have steadily declined.¹ Further, death sentences have reached record lows. ² However, LWOP sentences have reached record highs.³ We have never had more than 4,000 people on death row at a given time in this country, and after two decades of steady decline, there are currently 2,700 people on death row.⁴ Yet over 50,000 inmates are currently serving LWOP sentences, with the numbers steadily rising.⁵ Why has this happened? This Article is the first to explore case-level LWOP sentencing patterns to address this question. We focus on North Carolina, one of the leading LWOP-sentencing states, where LWOP is a mandatory sentence for firstdegree murder convictions.⁶ Our findings suggest that in the shadow of the declining death penalty, LWOP has emerged as a far more common, easily-imposed, and pervasive form of punishment, and yet it suffers from distinct racial biases and prosecution incentives.⁷

Today, policymakers and the public increasingly have reconsidered criminal sentencing practices in the United States, such as mandatory minimums, and drug sentencing—but have not done so with LWOP.⁸ Incarceration in the United States

has only slightly receded from record highs, at about 1.5 million people incarcerated.⁹ As the National Academy of Sciences put it in its report on the "historically unprecedented and internationally unique" growth of incarceration: the best explanation for this rise is not crime rates, "but the policy choices made by legislators to greatly increase the use of imprisonment as a response to crime."¹⁰ Longer prison sentences, including LWOP sentences, are important drivers of incarceration.¹¹

Before the 1970s, LWOP sentences did not exist in the United States; life sentences included the possibility of parole after a term of years.¹² LWOP statutes were enacted, largely beginning in the 1970s, in response to the concern that there be a certain "assurance to juries and victims' family members that perpetrators will not be set free" as well as in response to constitutional challenges to death sentencing statutes.¹³ In many of these states, LWOP was adopted as a way to ensure true "life" sentences, as the focus of state sentencing reforms shifted to retribution, or punishment based on moral culpability and just deserts.¹⁴ By the 1990s, a wave of states adopted "truth-in-sentencing" legislation that abolished or limited parole more generally for all sentences.¹⁵ Today, all states except Alaska have adopted LWOP. ¹⁶

The number of persons serving LWOP sentences is growing, with a current population of over 50,000 persons serving LWOP.¹⁷ In addition to those serving LWOP, others still serve life sentences, including those who are serving sentences so long that parole is not possible in their lifetime. Although, about one in nine people currently serving prison time—over 160,000 prisoners—is serving a life sentence.¹⁸ Ashley Nellis at the Sentencing Project has conducted a series of surveys of the LWOP population in the U.S. and has found that most of these tens of thousands of prisoners who are serving life were convicted of murder; sixty percent of those sentenced to LWOP were convicted of first-degree murder.¹⁹ But many (over 15,000) lifers were convicted of nonviolent crimes, like property offenses or drug offenses, and others (over 30,000) were convicted of non-homicide violent crimes such as sexual assault, robbery, or kidnapping.²⁰ Moreover, for homicide cases, death sentencing has reached record lows in the U.S., while at the same time, LWOP sentencing has reached record highs.²¹ Thus, the incarcerated population itself increasingly consists of people who by statute can never be released, absent clemency or pardon.²²

While research has increasingly documented the rise in LWOP sentences in the U.S., this Article is the first to empirically analyze case and local-level data to examine the rise in such sentencing. While LWOP is available in every state except Alaska, LWOP sentences are concentrated in a subset of states.²³ Researchers have carefully documented death sentencing patterns and collected county-level data permitting analysis of sentencing patterns in the context of country level crime and demographic information.²⁴ What has not been studied are the geographic differences

at the county level for LWOP sentencing. In this Article, we examine the rise in LWOP sentencing by conducting novel case-level and county-level analysis of LWOP sentencing in North Carolina.

In Part I, we describe when and how states adopted LWOP sentencing schemes. We describe the theory and rationales for adopting LWOP sentencing. We summarize prior empirical research on LWOP sentences. We then describe the adoption of LWOP in North Carolina and explain how the statute operates to mandate LWOP for first-degree homicide sentences.

In Part II, we set out our findings. This study builds on a prior piece that examines individual and county-level data for a much smaller population of juvenile LWOP sentences. ²⁵ That study examined the cases of ninety-four people sentenced to LWOP as juveniles in North Carolina, noting that juvenile LWOP sentences have sharply declined, and almost half of the sentences have been reversed on appeal.²⁶ However, homicide rates were not predictive of LWOP sentences, while county-level inertia effects (or the effect of past LWOP sentences) were.²⁷

This Article focuses on North Carolina case-level data concerning 1,627 people serving adult LWOP sentences, having been sentenced from 1995-2017, and federal data concerning county-level demographics and homicide rates.²⁸ Thus, we look at path dependency and LWOP sentencing, for the first time in the non-capital sentencing literature.²⁹ We ran regressions to see if a county's homicide rate, population density, poverty rate, the Black population proportion, and number of death penalty sentences were related to the number of LWOP sentences in that county. We examined the effects of the racial fragmentation of a county and separated the White and Black homicide rates in these regressions.

We find, in short, that homicide rates do not explain LWOP sentences. In fact, counties with higher homicide rates have fewer LWOP sentences. However, we troublingly find that counties with more Black victims of homicide do have statistically significantly fewer LWOP sentences, and that this is not the case for counties with more White victims of homicides. This race-of-victim effect is consistent with research on death sentencing patterns.³⁰ Second, we investigate if there is a relationship between a county using an LWOP sentence in the past and using it in the future. We find strong inertia or muscle memory effects, consistent across our models. Further, we find much stronger effects when one looks at prosecution

Capital Punishment, 66 DUKE L.J. 259, 264 (2016) (analyzing concentration of death sentences at the county level); Robert J. Smith, *The Geography of the Death Penalty and Its Ramifications*, 92 B.U. L. REV. 227, 230–34 (2012) (studying local level imposition of death sentencing).

²⁷ Id. at 165–66.

²⁸ The sources of these data are described *infra* Section II.A. We also look at prosecution districts, which often include several counties in North Carolina. *See* discussion *infra* Appendix A.

²⁹ For work looking at this phenomenon in death sentencing, see, e.g., the studies cited in GARRETT, END OF ITS ROPE, *supra* note 1, at 98–100.

³⁰ See infra Sections III.A and III.B.

districts and LWOP sentencing over time, as opposed to looking at individual counties. This provides stronger evidence that it is not other county-level trends, but rather the preferences of prosecutors, that are driving LWOP sentencing.

In Part III, we conclude by describing the implications of our findings for understanding prosecution incentives and behavior and for future efforts to improve sentencing policy. We conclude that the geographic disparities, race-of-victim effects, and inertia effects observed all show a lack of uniformity and concerns of bias in the use of LWOP. These results suggest reasons to be concerned with the use of LWOP for adults; at the same time, constitutional and legal challenges based on these empirical findings are not likely to be successful. Further research should investigate whether similar patterns exist in other states, and why there is variation in state use of LWOP. In addition, these findings can inform policy efforts directed at reconsidering severe sentencing and improving uniformity in criminal sentencing.

I. Understanding THE RISE OF LWOP

Why has the use of LWOP skyrocketed in the United States, especially during a time of declining crime, and homicide rates? In this Part, we first develop national trends in LWOP sentences, which have grown a great deal in the past two decades. We describe the rise in the adoption of LWOP as a sentence, largely since the 1970s, in all states except Alaska. Second, we summarize the theory and policy rationales and the debates concerning those rationales, for LWOP sentencing. Third, we describe the empirical literature regarding LWOP, including surveys of the LWOP population, research on juvenile LWOP, and recidivism research. Finally, we describe the background regarding the adoption of LWOP in North Carolina in 1994, as part of a 1990s move towards ending parole in the federal government and many states.

A. Theory and Policy Concerning LWOP Sentencing

Proponents of LWOP argue that the sentence fulfills the goals of incapacitation, deterrence, and retribution or "just deserts."³¹ However, critics believe LWOP either fails or is misguided in attaining each of those possible goals.

First, regarding the goal of incapacitation, LWOP ensures permanent incapacitation. Incapacitation can be effective in preventing additional crimes by the individual that is serving the punishment, at least in society (but not necessarily in prison). However, incapacitation also relies on potentially faulty predictions and assumptions. For example, Paul Robinson states, "for incapacitation to be effective as a distributive principle, one must be able to identify persons who will commit offenses in the future, preferably with a minimum of 'false positives' (persons predicted to be dangerous who in fact would not commit an offense.)"³² However, the justice system

³¹ Paul H. Robinson, *Life Without Parole under Modern Theories of Punishment, in* LIFE WITHOUT PAROLE: AMERICA'S NEW DEATH PENALTY? 138, 138 (Charles J. Ogletree, Jr. & Austin Sarat, eds. 2012).

³² *Id.* at 142.

relies on prior convictions as a measurement to predict future criminality, $.^{33}$ This is a highly overinclusive measure since the data suggests that criminality is highly correlated with gender and age, with 25 years of age considered the peak of one's criminal career.³⁴

Second, regarding deterrence, effective deterrence requires, first, in order to deter, that people be aware of the rule, and when it applies.³⁵ Second, even if people are aware of the rule, deterrence is only effective if people are able to determine what actions are in their best interests.³⁶ Lastly, even if the first two conditions are met, deterrence will only be effective if people conclude that the cost of being caught exceeds the potential benefits.³⁷ All three prerequisites for effective deterrence are troublesome but the first requisite, that the potential offender to be cognizant of the law, is especially problematic. LWOP statutes vary among jurisdictions, eligibility can depend on broad, vague, or complex criteria, and the likelihood that people know their own state's law is unlikely. This is especially true of those who may receive LWOP for a non-violent crime due to a habitual offender statute. Potential offenders cannot be deterred from an action if they do not know the consequences.

A third justification for LWOP is fitting the sentence to the crime or giving the offender their just deserts. However, many people serving LWOP sentences did not commit the most severe offenses. As previously stated, habitual offender statutes make it possible for a person to receive LWOP even if none of their crimes are violent.³⁸ Felony murder charges can result in LWOP even if the person is not the one who committed the crime.³⁹ For example, in a North Carolina case, Sethy Seam was sentenced to LWOP as a 16-year-old under the felony murder statute.⁴⁰ Seam was in the car while his friend robbed a convenience store and shot the clerk three times leading to his death.⁴¹ Seam claimed he did not even know that his friend had a gun and never entered the store, yet he received LWOP (his co-defendant took a plea offer and received a lesser sentence).⁴² Drug offenses invoke a similar problem: while they may be serious, rarely is a drug offense as severe a crime as murder. Yet, under some

 $^{^{\}rm 42}$ See id. at 154–55. .

drug sentencing statutes, people can receive LWOP.⁴³ Such cases call into question the just deserts justification for LWOP.⁴⁴

Indeed, the international view is that there is no retributive or other justification for a LWOP sentencing practice, and that, to the contrary, such sentences violate human rights. Most industrialized countries have abolished LWOP sentencing as contrary to human rights obligations. The European Court of Human Rights banned LWOP sentences for countries under its province.⁴⁵ In its decision, the Court interpreted LWOP as inhumane and in conflict with the goals of their justice system.⁴⁶ The Court also noted that rehabilitation was constitutionally required for any "community that established human dignity as its centerpiece."⁴⁷ The International Criminal Court, which tries cases such as genocide, war crimes, and crimes against humanity, does not have an LWOP option and even the harshest sentences require review after twenty-five years.⁴⁸ Although people in the United States may see LWOP as a more lenient sentence than the death penalty, the international community considers the punishment a human rights violation.

B. Adoption of LWOP Statutes

Before the 1970s, the most severe term-of-years sentences imposed were life sentences.⁴⁹ Life sentences were imposed through an indeterminate sentence with fixed minimum years of imprisonment, or in a mandatory form without any minimum term fixed.⁵⁰ In both situations, the parole board could permit prisoners parole release and there was a set minimum term after which the parole authority could consider early release.⁵¹ In 1970, only seven states prohibited parole eligibility for life sentences (Massachusetts, Michigan, Mississippi, Nebraska, Nevada, Pennsylvania, and West Virginia).⁵²

In the 1970s, a period in which the constitutional status of capital punishment was in flux, LWOP emerged as an alternative to the death penalty. In 1972, the Supreme Court ruled that the application of the death penalty, as it then was being

 $^{^{52}}$ <u>Id</u>. at 5–8.

applied, was unconstitutional.⁵³ Four years later, the Supreme Court ruled that if states satisfied constitutional requirements, then they could continue to impose death sentences.⁵⁴ Furthermore, the Supreme Court held that mandatory death penalty statutes (like the one adopted in North Carolina) were unconstitutional and that states must have an alternative sentence available.⁵⁵ The alternative sentence typically selected was LWOP.⁵⁶ In addition, some death penalty abolitionists became proponents of LWOP as an alternative to capital punishment.⁵⁷ Thus, the status of LWOP as alternative to the death penalty contributed to its broader adoption and use during this time period.⁵⁸

By the mid-1990s, a broader driver of LWOP adoption was that states increasingly rejected parole entirely, for many or all types of sentences. LWOP statutes reflected a new legislative desire to focus on retribution and just deserts rather than rehabilitation.⁵⁹ Although the death penalty could only be applied in homicide cases, following the Supreme Court's ruling in *Coker v. Georgia*,⁶⁰ LWOP did not have such constraints.⁶¹ Many non-homicide felonies such as kidnapping, armed robbery, and sexual battery could result in an LWOP sentence.⁶² Additionally, New York's Rockefeller Drug Laws enabled the state to sentence serious drug offenders to life sentences.⁶³ Michigan's "650-Lifer Law" mandated LWOP sentences for sale, manufacture, or possession of 650 grams of cocaine or heroin.⁶⁴ Three-strikes laws were adopted under the theory that if a person commits a crime three times, they are unable to be rehabilitated.⁶⁵ In 1994, Congress passed a version of threestrikes laws in the Violent Crime Control and Law Enforcement Act.⁶⁶ The federal three-strikes law mandated LWOP for people convicted of a federal offense if they

had two prior offenses that resulted in state or federal convictions.⁶⁷ States quickly followed suit and currently all 50 states and the federal government use enhanced sentences for habitual offenders, and of those, thirty states and the federal government use LWOP as the enhanced punishment.⁶⁸

By 2014, all American jurisdictions except for Alaska adopted LWOP as a sentence.⁶⁹ The structure of these statutes varies. For example, six states (Maine, Pennsylvania, South Dakota, Illinois, Iowa, and Louisiana) and the federal system have an LWOP statute but no life with parole alternative; in other words, parole is not available to anyone serving a life sentence.⁷⁰ Other states, as noted, require LWOP sentences for certain crimes, but require or permit life sentences with parole for others, including through repeat or habitual offender provisions.⁷¹

We note that in contrast to adult LWOP, juvenile LWOP has been impacted by constitutional rulings. The U.S. Supreme Court's ruling in *Miller v. Alabama*⁷² forbade mandatory LWOP for juvenile homicide offenses and mandated that sentencing judges consider such offenders' "youth and attendant characteristics" before imposing "the harshest possible penalty."⁷³ Following the *Miller* ruling,⁷⁴ North Carolina lawmakers enacted a new statute requiring sentencing court to consider "all the circumstances of the offense" as well as the "particular circumstances of the defendant," and "any mitigating factors."⁷⁵ Further, the North Carolina Supreme Court ruled that the statute creates no presumption in favor of LWOP.⁷⁶ Factfinders should select a sentence "in light of the United States Supreme

⁷² 567 U.S. 460 (2012).

⁷⁴ The resulting statute was titled "An Act To Amend The State Sentencing Laws To Comply With The United States Supreme Court Decision In Miller v. Alabama." 2012 N.C. Sess. Laws 713 (codified as amended at N.C. GEN. STAT. §§ 15A-1476 to 1479). The prior statute made LWOP sentences mandatory. N.C. GEN. STAT. § 14–17 (2009) ("[A]ny person who commits [murder in the first degree] shall be punished with death or imprisonment in the State's prison for life without parole as the court shall determine pursuant to [N.C. GEN. STAT.] [§] 15A-2000, except that any such person who was under 18 years of age at the time of the murder shall be punished with imprisonment in the State's prison for life without parole"); N.C. GEN. STAT. § 14-17(a) (2013) (removing the LWOP requirement for persons under 18 years of age); § 15A-1340.19B (2013) ("If the sole basis for conviction of a count or each count of first degree murder was the felony murder rule, then the court shall sentence the defendant to life imprisonment with parole.").

⁷⁵ N.C. GEN. STAT. § 15A-1340.19C (2020). The mitigating factors to be considered in sentencing include: (1) the offender's age at the time of offense; (2) immaturity; (3) ability to appreciate the risks and consequences of the conduct; (4) intellectual capacity; (5) prior record; (6) mental health; (7) familial or peer pressure exerted upon him; (8) likelihood that he would benefit from rehabilitation in confinement; and (9) other mitigating factors and circumstances. § 15A-1340.19B.

Court's statements in *Miller* and its progeny" which state that LWOP sentences "should be reserved for those juvenile defendants whose crimes reflect irreparable corruption rather than transient immaturity."⁷⁷ In addition, North Carolina lawmakers in 2013 removed juvenile LWOP for felony murder.⁷⁸

C. Empirical Research on LWOP Sentencing

Nationwide, the number of prisoners serving LWOP has steadily grown over the past two decades.⁷⁹ The rise in LWOP during that time period has increased four times as quickly as indeterminate life sentences (sentences with a maximum of life imprisonment); LWOP sentences increased by 59% whereas indeterminate life sentences increased by 17.8%.⁸⁰ Interestingly, "while serious crimes, including murder have generally declined for the past 25 years nationwide the number of lifers in prison has continued to rise."⁸¹ If crime has generally declined, then we must look to a number of contributing factors that explain the growth in LWOP sentences. These include inflexible statues, misinformed assumptions about recidivism, and rejection of the idea of rehabilitation.⁸² The frequency with which LWOP is used also varies state to state. In Louisiana, 10.9% of people in prison are serving LWOP sentences.⁸⁴ However, there is an opposite trend in 15 states where less than 1% of the prison population is serving LWOP.⁸⁵

As noted, one rationale for the adoption of LWOP is the assumption that individuals who commit crimes that are worthy of such a sentence are highly likely to re-offend and are incapable of rehabilitation.⁸⁶ However, emerging science indicates that age at the time of offense is one of the most accurate predictors of criminal behavior.⁸⁷ The social and psychosocial developments that occur during a person's early 20s make them the most likely to reoffend.⁸⁸ Criminal offenses decline as a person ages into their mid-20s and flattens out by one's late 30s.⁸⁹ These age trends are true across crime types. The Sentencing Project found that people who

were released from life sentences were less than one-third as likely to be rearrested within three years compared to all released prisoners.⁹⁰ Specifically, while two-thirds of people who were released in 1994 were rearrested within three years, only 20% of people who were released from a life sentence were rearrested.⁹¹

Prior empirical research has examined juvenile LWOP sentencing, including in a prior study examining such sentences in North Carolina.⁹² That study described a rise in such sentences following adoption of LWOP in 1994, but a decline in more recent years, as well as a rise in reversals on appeal.⁹³ The study examined the cases of the 94 people in North Carolina who were sentenced to LWOP as juveniles from 1994 to present.⁹⁴ Their ages at the time of the offense ranged from 13 to 17.⁹⁵ Of those, forty-eight are currently serving LWOP sentences (one more is currently pending retrial).⁹⁶ Several patterns stand out in the juvenile data. First, juvenile LWOP sentencing has declined markedly since its late-1990s height in North Carolina; beginning in 2011, there have been either one or no such sentences each year.⁹⁷ Second, juvenile LWOP sentences were highly concentrated in a handful of counties.⁹⁸ Third, race disparities in juvenile LWOP sentences mirror race disparities in juvenile homicide offending in North Carolina.⁹⁹

There are reasons to think that adult LWOP sentences would not exhibit the same patterns as found in juvenile LWOP cases, and that instead, the use of adult LWOP would be far more common, across more counties, but perhaps also reflecting disparities due to the use of prosecutorial discretion. Both U.S. and North Carolina Supreme Court regulation of juvenile LWOP sentences has resulted in a decline in its use and in the reversal of many of the prior sentences imposed.¹⁰⁰ Not only are adult LWOP sentences more common, but they have not been constitutionally regulated.¹⁰¹ There is far more prosecutorial discretion to seek such sentences, given the broad definition of first-degree murder, and as a result, they might exhibit different geographic patterns in their use. Further, for adults, the death penalty is available for some first-degree murders, and there may be more of a connection between adult LWOP sentencing and death sentencing patterns. We examine each of

those questions in this study.¹⁰² First, however, we turn to the adoption of LWOP in North Carolina.

D. North Carolina Adoption of Life Without Parole

North Carolina adopted LWOP in 1994, as part of the change from the prior sentencing scheme, termed "Fair Sentencing" (after the Fair Sentencing Act ("FSA")), to a new scheme termed "Structured Sentencing."¹⁰³ The goals of the Structured Sentencing Act ("SSA") were to provide rational, truthful, and consistent sentences.¹⁰⁴ The Act applies to most misdemeanor and felony crimes committed on or after October 1, 1994.¹⁰⁵ Under the SSA, first-degree homicide is punishable by either by a death sentence or life without parole, but not a term of years.¹⁰⁶

Not only are the possible punishment alternatives extremely severe, but at the same time, first-degree homicide is defined extremely broadly in North Carolina.¹⁰⁷ The statute, in addition to specific types involving poison, torture, or weapons of mass destruction, defines first-degree murder as any other kind of "willful, deliberate, and premeditated killing."¹⁰⁸ Further, any murder that is committed as part of the commission or attempted commission of "arson, rape a or sex offense, robbery, kidnapping, [or] burglary," or any "other felony committed or attempted with the use of a deadly weapon," qualifies as first-degree murder under North Carolina's felony murder provision.¹⁰⁹ Thus, any murder, regardless of premeditation, that involved the use of a gun or knife could be charged as a first-degree murder. The statute gives prosecutors wide discretion, then, to seek LWOP sentences in murder cases.

More broadly, the SSA eliminated parole for all offenders, meaning that inmates sentenced under the SSA were no longer able to achieve early release through good behavior or other means and it defined all life sentences as "natural life" sentences with no possibility for parole.¹¹⁰ The SSA had several consequences, both intended and unintended. One study showed that in comparison to inmates sentenced under previous sentencing law in North Carolina, those sentenced under

¹⁰³ 1993 N.C. Sess. Laws 2299 (codified as amended at N.C. GEN. STAT. § 15A, art. 81B). For four years, until the provision was repealed in 1998, the North Carolina statute also provided a safety valve in the form of judicial review of LWOP sentences after twenty-five years of imprisonment; sentences entered during that window will be eligible for review beginning in 2019. N.C. GEN. STAT. § 15A-1380.5 (repealed 1998).

 $^{^{110}}$ See 1994 North Carolina Laws 1st Ex. Sess. Ch. 7 (mandating offenders to serve at least 100% of minimum sentence and 85% of maximum sentence).

the SSA had higher overall in-prison infraction rates—25% higher for males and 55% higher for females.¹¹¹ This increase may be due to the lack of incentive to be compliant under determinate sentencing schemes, as there is no early release for good behavior.¹¹² Another report found that while the use of prison for violent crimes remained the same under the SSA, the length of prison terms went up substantially.¹¹³ The prison population in North Carolina, however, is no longer rising as rapidly as it was pre-FSA.¹¹⁴ Scholars believe this slowdown is due to lighter sentences given for non-violent and non-drug related crimes, as well as a reduction in crime statewide.

As of the end of 2017, 1,627 offenders were serving LWOP sentences in North Carolina.¹¹⁵ African-Americans make up the majority of the population with 1,005 people, followed by 496 Whites, and 126 Other.¹¹⁶ There were 1,543 men serving LWOP sentences and 84 women.¹¹⁷ The vast majority of these offenders (1,582) were convicted of first-degree murder.¹¹⁸ The second most frequent offense is violent habitual felonies (64).¹¹⁹ The average age at conviction in North Carolina is thirty-two years old and the current average age of someone serving an LWOP sentence is forty-three years old. The county in which an offender is convicted varies and closer analyses are described in Part II.

The overall trend in adult LWOP sentences in North Carolina is shown in Figure 1. Following adoption of LWOP in 1994, sentencing rose sharply and has remained at a fairly steady level since 2000. In contrast to the rise in LWOP, Figures 2 and 3 show the steady decline in the number of death sentences and homicide rates in North Carolina across that same time period.

Figure 1: Adult LWOP Sentences in North Carolina, 1995-2017

Figure 3: Homicide Rates in North Carolina, 1995-2017

By way of comparison, the trends in juvenile LWOP in North Carolina are markedly different; juvenile LWOP sentences experienced a similar rise upon adoption in 1994, but have since sharply declined.¹²⁰ Moreover, as noted, almost half of the sentences that were imposed have been reversed on appeal.¹²¹

Somewhat similar to juvenile LWOP, death sentencing in North Carolina also exhibits a very different trend from adult LWOP sentencing. In the 1990s, twenty-five or more death sentences were imposed in some single-year periods, as shown in Figure 2. Like juvenile LWOP sentencing though, since 2001, less than five death sentences per year have been imposed in most years, and in some years, none have been imposed.¹²²

In 2001, a state law created a statewide Indigent Defense Services office to support defense representation, and granted prosecutors the discretion whether to seek the death penalty.¹²³ Prior to 2001, prosecutors were required to seek the death penalty in first-degree homicide cases in which they found death-eligible aggravating circumstances present. However, after this act was adopted, prosecutors received discretion in capital charging decisions, and could instead, for example, seek LWOP for an otherwise capitally-eligible first-degree murder charge.¹²⁴

¹²⁴ See N.C. GEN. STAT. § 15A-2004 (LexisNexis current through Session Laws 2020-35).

In the sections that follow, we analyze data concerning LWOP sentences in North Carolina. The first section describes the sources of these data. The next three sections describe our exploratory analyses and findings.

First, we explored whether county-level characteristics predict the frequency of LWOP sentencing. Specifically, we assessed whether a county's homicide rate, population density, poverty rate, the Black population percentage, and the number of death penalty sentences were related to the number of LWOP sentences in that county. We also explored whether the racial fragmentation of a county was related to the number of LWOP sentences in that county.¹²⁵ Furthermore, we separated the homicide rate by White and Black victim rates by county (the FBI does not collect data on homicide rates for other racial or ethnic groups) in order to see if the victim's race related to the number of LWOP sentences.¹²⁶

Most inmates serving LWOP have been convicted of first-degree murder, for which an LWOP sentence is mandatory (if there is not a death sentence). Although the LWOP sentence is mandatory for first-degree murder, prosecutors have discretion whether to charge that offense (and it is quite broadly defined, as noted, including with a broad felony murder theory.) For this reason, we also explored whether countylevel characteristics predict the frequency of LWOP sentencing. We explored whether a prosecutor district's homicide rate, poverty rate, the percentage of a district's Black population, and the number of death penalty sentences were related to the number of LWOP sentences in that county.

Lastly, we examined the inertia effect in each county. That is, we investigated if there is a relationship between a county using an LWOP sentence in the past and using it in the future. We aimed to assess whether there is path dependency in county-level charging patterns over time.

A. Sources of Data

Data concerning life without parole sentences was obtained from the North Carolina Department of Public Safety website, and verified against data supplied directly from the Department of Public Safety.¹²⁷ This allowed us to capture cases in which persons were sentenced to LWOP in the past, but are not currently serving such a sentence due to a successful appeal, clemency, or because they are deceased.

¹²⁵ A racial fragmentation measure reports the probability that two randomly selected individuals in a jurisdiction belong to different racial groups. Alberto Alesina et al., *Fractionalization*, 8 J. ECON, GROWTH 155, 156 (2003).

¹²⁶ ERICA L. SMITH & ALEXIA COOPER, BUREAU OF JUST. STAT., U.S. DEP'T OF JUST., HOMICIDE IN THE U.S. KNOWN TO LAW ENFORCEMENT, 2011, at 16 (December 2013) ("Due to the lack of reporting of ethnicity by submitting law enforcement agencies, homicide rates by Hispanic or Latino origin were not calculated.").

¹²⁷ See infra Appendix B (summarizing the county level data). Many thanks to Professor James Markham for assistance in contacting the North Carolina Department of Public Safety, Division of Adult Correction and Juvenile Justice, and to Duke Law Digital Resources Librarian Sean Chen for his invaluable work scraping and formatting these data.

Data concerning death sentences was obtained from a prior research collection concerning all death sentences from 1990-2017.¹²⁸

The homicide rate, measured as the number of homicides per 100,000 inhabitants in each county-year was provided by the FBI's Supplemental Homicide Reports.¹²⁹ We also include the county homicide rate for White victims and the homicide rate involving Black victims in additional analyses.

The percent of the Black population in each county was provided by the U.S. Census Bureau.¹³⁰ The density of each county's population, measured as the number of people per square mile of land, was also provided by the U.S. Census Bureau, as was the poverty rate of each county, defined as the percent of families within the county living in poverty, based on the applicable poverty thresholds.¹³¹

In North Carolina, there are currently 43 prosecutor districts,¹³² but, depending on the year, that number fluctuates; since 1990, lawmakers have altered the prosecutor district map several times. In order to obtain district-level data throughout this time period, data for each county belonging to a district during a particular year from 1990 to 2017 was aggregated. For some of the independent variables, this was a straightforward process. For example, the number of LWOP sentences and the number of death sentences were simply summed across counties for each district for each year. We describe district-level findings in Appendix A.

B. County and District Characteristics and the Application of LWOP Sentences

A series of maps were created by aggregating all adult LWOP sentences across all NC counties (Figure 4) during the period from 1995 to 2017. The shade of each county corresponds to the number of observed LWOP sentences. Here, darker colors represent more LWOP sentences and lighter colors indicate fewer LWOP sentences.

Figure 4. Number of LWOP Sentences in North Carolina across Counties and Time

	Asian	16	<1%
	Native American	42	3%
	Other	63	5%
	Unknown	5	<1%
Gender	Male	1,543	95%
	Female	84	5%

Table 1. Descriptive Profile of Adult LWOP Population in North Carolina,1995-2017

As shown in Table 1, 1,551 of the 1,627 persons who were sentenced to LWOP from 1995 to 2017 in North Carolina, were listed as having committed murder (first or second degree) as their primary crime.¹³³ Observing the counties which most frequently applied LWOP sentences between 1995 and 2017 (Cumberland, Guilford, Meckenblerg and Wake counties), they had on average, a 5.9 homicide rate and an average of 14.8% families living in poverty. By contrast, the average county in North Carolina had 13.3% of families living in poverty and an average homicide rate of 5.8 in 2010.

Figure 5. Number of LWOP Sentences in North Carolina in county-year format and prosecutorial district-year format

¹³³ North Carolina Life Without Parole, CTR. FOR OPEN SCI., https://osf.io/m7gk8/files/<u>[perma TBD]</u> (providing the data used in this study).

The data concerning LWOP sentences for each of the 1,627 cases was transformed into a county-year dyad format in Figure 5A. This transformation allowed us to conduct a series of statistical analyses in order to determine which county-level characteristics were correlated with more adult LWOP sentences. The LWOP sentences data was also transformed into a prosecutorial district-year dyad format in Figure 5B, and those analyses are discussed in the Appendix. Since there are 100 counties in North Carolina and the LWOP sentencing data covers 23 years (1995 to 2017), there are 2,300 observations under this arrangement. A number of independent variables related to each county in North Carolina were also merged with our data on LWOP sentencing.¹³⁴

The dependent variable in Figure 5A is the frequency of LWOP sentences and measures the number of LWOP sentences within each county for each year. Around 65% of the time, there were zero LWOP sentences in a given county for a given year. The dependent variable has a mean value of 0.71 and a standard deviation of 1.37.

A Poisson regression was chosen as the appropriate regression model for two reasons. First, the dependent variable is a count variable (0, 1, 2, 3, etc.), which means a discrete probability distribution such as the Poisson distribution or the negative binomial distribution is needed to accommodate these data. Second, the Poisson distribution accommodated the data well and required fewer parameters than other discrete probability distributions such as the negative binomial distribution.¹³⁵ A

¹³⁴ Fixed effects for counties were also included in each model to control for unobserved and heterogenous relationships within the data. *See infra* Table 2.

 $^{^{135}}$ The negative binomial distribution is used to model data that are heavily skewed, or, in other words, when the variance of the distribution far exceeds the mean of the distribution. ALAN AGRESTI, CATEGORICAL DATA ANALYSIS 559–63 (2d ed. 2002). When the data are not heavily skewed, the Poisson distribution is used because it assumes the mean of the data is approximately equal to the variance in the data. *Id.* at 663–65. The distribution of county-year LWOP sentences (Figure 5A) and the

simple robustness check was also performed by visually inspecting the raw data. Figure 5 shows the county-year and district-year distributions plotted, collapsed across time. These distributions do not exhibit the extreme skewedness needed in order to reject the Poisson distribution and explore alternative distributions (such as the negative binomial).

Before running the Poisson regressions, each continuous independent variable was centered and scaled so that the distribution of values was set to have a mean of 0 with a standard deviation of 1. This put all of the continuous independent variables onto a comparable scale. The county-level results of a set of Poisson regressions are presented in Table 2. The district-level results of a similar set of Poisson regressions are presented in Appendix A. The Poisson regression estimates a coefficient for each variable (or predictor) in the model. If a variable is estimated to have a negative coefficient, then increases in that variable predicts fewer LWOP sentences. If a variable is estimated to have a positive coefficient, then increases in that variable predicts more LWOP sentences. The extent to which LWOP sentences are predicted to increase or decrease depends on the value of the coefficient. For example, a large coefficient means that for every one unit increase in a predictor (and when holding all other predictors in the model equal), LWOP sentences will increase by that large amount.

1. Homicide Rates

As was shown in Figure 3, since LWOP was adopted in North Carolina, homicide rates have generally fallen. For example, in 2017, the state reported 637 murders, for a rate of 7 per 100,000 persons;¹³⁶ in 1994, when the SSA was adopted, there were 759 murders for a rate of 11.2 per 100,000.¹³⁷ In contrast, as noted in Figure 1, LWOP sentences have remained fairly constant, since their rise following the adoption of the SSA.

That said, it is important to note that the homicide rate variable supplied by the FBI includes homicides other than first-degree homicide. As such, even though the homicide rate may be decreasing in the state or in a county over time, it does not imply the rate of first-degree homicide is decreasing within the county. For this reason, we cannot more precisely specify the relationship between homicide rates and LWOP sentencing, nor can we measure culpability. That said, the homicides that consist of first-degree homicide still involve a degree of prosecutorial discretion. Firstdegree homicide is defined as including certain specific types of murders involving poison, torture, or weapons of mass destruction, but also as any other kind of "willful,

¹³⁶ N. C. STATE BUREAU OF INVESTIGATION, CRIME IN NORTH CAROLINA – 2017, at 2 tbl.2 (2018), http://crimereporting.ncsbi.gov/public/2017/ASR/2017%20Annual%20Summary.pdf [https://perma.cc/K27T-LZ7M].

¹³⁷ See North Carolina Crime Rates, 1960-2018, at http://www.disastercenter.com/crime/nccrimn.htm.

deliberate, and premeditated killing."¹³⁸ Those terms are not defined in the statute and they involve some degree of interpretation by prosecutors and by jurors.

We find, as shown across all models in Table 2, a statistically significant *negative* correlation between the homicide rate and adult LWOP sentences. This suggests that as the homicide rate increases within a county, we should expect to observe fewer LWOP sentences. In Model 1B, we replace homicide rate with a variable that represents the homicide rate for Black victims in each county and again we observe a negative relationship. Here, the result implies that as the homicide rate for Black victims increases, we expect to observe fewer LWOP sentences. However, when we include the homicide rate for White victims in Model 1C, there is no statistically significant relationship between this homicide rate and the use of LWOP sentencing. In Models 2 and 3, there is also a statistically significant negative correlation between the homicide rate and the number of LWOP sentences.

The finding of a *negative* correlation between the homicide rate in a county and the number of LWOP sentences we observe in that county, is perhaps surprising. With LWOP as a mandatory sentence for first degree homicide, one might expect LWOP sentences to be *positively* correlated with the homicide rates (assuming that first-degree homicides are a fairly consistent proportion of homicides in general). That is, one might expect there to be more LWOP sentences in counties with more homicides. In section III.A, we discuss one possible reason for this finding and note that in the death sentencing literature, one observes the same negative correlation, suggesting that serious sentencing is not as closely correlated with serious offending in a manner that people might intuitively expect.

Further, the results imply that this negative correlation is driven by the homicide rate for Black victims of a county or district. The correlation is not statistically related to the homicide rate for White victims in a county or district. That suggests, then, that race matters, and in a way connected to the race of the victim. This finding is consistent with findings in prior death sentencing research, in which death sentencing has been observed to correlate with White victimization among homicides (a stronger correlation than what we observe here), and similar to what we observe here, Black victimization is negatively correlated with death sentencing.¹³⁹ One further explanation for this result is that the counties and districts with the highest homicide rates are generally less likely to use LWOP and instead rely on other forms of sentencing, including death sentencing.¹⁴⁰

¹³⁸ N.C. GEN. STAT. § 14-17(a) (2020).

¹³⁹ See infra Section III.A.

¹⁴⁰ But see Theodore Eisenberg, Death Sentence Rates and County Demographics: An Empirical Study, 90 CORNELL L. REV. 347, 358 (2005) (finding a negative relationship between county homicide rates and the rate of death sentencing). Once again, the results imply that as the percent of the Black population in a county increases, the less likely we are to observe adult LWOP sentences in that county. However, it is important to note the racial fragmentation measure in Model 7 was determined to not be statistically related to observing one or more LWOP sentences. Yet, Models 1, 2, 3, 4, 5 and 6 in Table 2 suggest there is a negative relationship between the Black population share in a county and the likelihood we observe at least one LWOP sentence. For additional work observing race of victim disparities in death sentencing in North Carolina, see, e.g., Barbara O'Brien et al., Untangling

1A. Four County Analysis - Homicide Rates

To further unpack the relationship between homicide rates and LWOP sentencing, in Figure 6 we calculated the predicted probability of observing an LWOP sentence as well as the predicted number of LWOP sentences for four counties: Durham, Guilford, Robeson, and Wake. These four counties were chosen to provide a varied sample of counties found in North Carolina. Guilford County, for example, is a small county, with an average household income of \$42,618 and has a Black population which comprises around 29% of the county's population. Wake County on the other hand, is geographically larger and wealthier, and is also home to North Carolina's state capital, Raleigh.

Figures 6A, 6B, and 6C reflect the probability of observing an LWOP sentence in each of these four counties. This data was generated by holding all other variables in Models 1A, 1B, and 1C of Table 2 constant and allowing the homicide rate to vary from zero to forty-three. Figures 6D, 6E, and 6F reflect the predicted number of LWOP sentences in each of these four counties. Similar to the top panel of figures, the data in the bottom panel was generated by holding all other variables in Models 1A, 1B, and 1C of Table 2 constant and allowing the homicide rate to vary from zero to forty-three.

Figures 6A and 6D were based on Model 1A, which revealed a significant, negative correlation between homicide rate and LWOP sentencing. Each county in Figures 6A and 6D reflect this significant, negative correlation. As the homicide rate increases, the probability of LWOP sentence (6A) and the predicted number of LWOP sentences (6D) decreases. This negative relationship is very pronounced in Durham, Guilford and Robeson counties and less pronounced in Wake County.

Figures 6B and 6E were based on model 1B. These figures explore the relationship between the Black-victim homicide rate and LWOP sentencing. Model 1B revealed a significant, negative correlation between Black-victim homicide rates and LWOP sentencing. Each county in Figure 6B and 6E reflects this significant, negative relationship. Generally speaking, a similar pattern of results is found whether general homicide rates (Model 1A) or black-victim homicide rates (Model 1B) were analyzed.

Figures 6C and 6F were based on Model 1C. These figures explore the relationship between the White-victim homicide rate and LWOP sentencing. Unlike the general homicide rate and Black-victim homicide rate, the White-victim homicide rate was not significantly related to the probability of observing LWOP sentences, as shown in Table 2. Figures 6C and 6E show that across these four counties, an increase

the Role of Race in Capital Charging and Sentencing in North Carolina, 1990-2009, 94 N.C. L. REV. 1997, 2023–26 (2016); Isaac Unah, Empirical Analysis of Race and the Process of Capital Punishment in North Carolina, 2011 MICH. ST. L. REV. 609, 639–48 (2011). For additional work observing race of victim disparities in death sentencing in North Carolina, see generally Amy R. Stauffer et al., The Interaction Between Victim Race and Gender on Sentencing Outcomes in Capital Murder Trials: A Further Exploration, 10 HOMICIDE STUD. 98, 107–11 (2006)..

in the White-victim homicide rate does not significantly reduce the probability of an LWOP sentence (6C) or the number of LWOP sentences (6F).

Together, these results highlight racial disparities in LWOP sentencing across a small, but varied, collection of counties in North Carolina. Fewer LWOP sentences are predicted to occur as the number of Black victim homicides increase, but no such relationship is found when considering the number of White victim homicides.

Figure 6. Predicted probability and predicted number of LWOP Sentences in North Carolina in county-year format given a range of homicide rates

Note: Thick lines represent model estimate. For 95% confidence intervals, please see the online, colored version of this figure.

2. Race and LWOP Sentencing

The Black population share within a county is sometimes estimated to have a statistically significant and negative relationship with the number of LWOP sentences applied in a county as shown in Model 2A of Table 2. However, that relationship was not statistically significant. If, for example, we were to compare two counties that were identical in every possible way, but one county had a smaller Black population than the other, we would expect to observe fewer LWOP sentences in the

county that has the larger Black population. To further address the relationship between the racial composition of a county and the use of LWOP sentencing within the given county, a racial fragmentation measure was developed to serve as a proxy for the racial demography of the counties in our study. This measure reports the probability that two randomly selected adult individuals from a county would belong to different racial groups.¹⁴¹ Though the effect is not statistically significant, the result in Model 2B implies that as racial fragmentation increases within a county we are less likely to observe more LWOP sentencing in the county.¹⁴²

3. Population Density

We find that the population density has a statistically significant negative correlation with observing more LWOP convictions in Models 1, 2, and 3. Generally speaking, this suggests that more rural counties are more likely to observe LWOP sentences than more urban counties. In an additional robustness check we found the count of adults within a county as reported by the U.S. Census, yielded similar results as population density measures in Table 1.

4. Death Sentencing

In another relative surprising finding, we find that death sentencing is not significantly related to LWOP sentencing, in another relatively surprising finding. After all, one might expect that the same prosecutors that are inclined to seek death sentences would also be more included to seek LWOP sentences. As Table 2 displays, for Model 3B, we find there is no statistically significant relationship between the number of previous death sentences within a prior county-year and the number of LWOP sentences observed within that county in a current year. This finding suggests that a county's decision to apply a death penalty sentence is driven by a different mechanism than the decision to apply an LWOP sentence. Indeed, there is considerable discretion whether to seek a death sentence and only a very narrow group of cases are capitally eligible. LWOP, on the other hand, is mandatory for all first-degree murder cases in North Carolina.

5. The Inertia Effect

¹⁴¹ A measure of racial fragmentation was previously utilized in empirical work by GARRETT, *supra* note 1, at 267.

¹⁴² It is important to note the racial fragmentation measure is collinear with the black population share variable–as both are measures of racial composition. Following standard practice, model 7 included only racial fragmentation and does not include black population share. Another general convention in the literature suggests the black population share variable is less susceptible to incorrect interpretations when included in a statistical model. *See* Chad R. Farrell, *Bifurcation, Fragmentation or Integration? The Racial and Geographical Structure of US Metropolitan Segregation, 1990—2000,* 45 URB. STUD. 467, 476–77 (2008).

Prior research on both death sentencing nationally and juvenile LWOP sentencing in North Carolina specifically, has shown strong inertia effects, in which prior sentences are associated with subsequent sentencing patterns.¹⁴³ County level "muscle memory" powerfully explains the concentration of death sentences at the local level.¹⁴⁴ That path dependency can occur of prosecutors develop a preference for imposing severe sentences, but also when amenable judges and jurors, prosecution resources, and inadequate defense lawyers, all facilitate such local patterns.¹⁴⁵ We sought to examine whether the same type of path dependency can be observed in LWOP sentencing in North Carolina. Where the sentence is mandatory, and unlike death sentences does not involve jury decision-making, this inertia effect may more closely be attributed to prosecutorial decision-making. However, because there is less discretion involved in seeking LWOP for adult first-degree homicide than in deciding whether to seek LWOP for a juvenile, we might expect there to be less inertia in such decision-making, particularly when controlling for homicide rates. We relied on the statistical estimates, presented in the following sections, to answer the question of whether there is inertia in LWOP sentencing.

A strong inertia effect, as we term it, is found in model 3A in Table 2. Here, we find the number of previous LWOP sentences in a prior county-year is strongly, positively correlated with observing more LWOP sentences in a county's current year. This finding is statistically significant and supports the prediction of an inertia effect in adult LWOP sentencing. Each analysis we conducted observed institutional, social, and economic county-level characteristics to understand under what conditions are adult LWOP sentences more likely to be observed. We conclude from these empirical assessments that the number of previous adult LWOP sentences in a prior county-year has one of the strongest relationships with an increased probability of adult LWOP sentences. While our analyses are limited to just counties from North Carolina, we suspect the observed inertia effect found within North Carolina is generalizable to other states, and we plan to investigate that question in future work.

5A. Four County Analysis - Prior LWOP Sentences

To further unpack the inertia effect results, we calculated the predicted probability of observing an LWOP sentence and the predicted number of LWOP sentences for four counties: Durham, Guilford, Robeson, and Wake (see Figure 7). As mentioned previously, these four counties were chosen to provide a varied sample of counties found in North Carolina. Both Figure 7A and 7B were based on model 3A in Table 2. Figure 7A shows that as the number of previous LWOP sentences increases we are more likely to observe more LWOP sentences—however the strength of this relationship varies across counties. Overall, the results suggest different counties have different propensities to implement LWOP sentences and as the number of

¹⁴³ Finholt et al., *supra* note 25, at 165–67.

previous LWOP sentences increases so does their propensity to assign LWOP sentences.

Note: Thick lines represent model estimates. For 95% confidence intervals, please see the online, colored version of this figure.

III. Implications

This first empirical analysis of case, county, and prosecution district-level characteristics of adult LWOP sentences has implications for our understanding of serious sentences and how they are imposed in the U.S. While research has illuminated geographic and race disparities in death sentencing, as well as juvenile LWOP sentencing, this study shows that similar concerns of prosecutorial discretion, racial bias, and path dependency exist for the far larger numbers of adult LWOP sentences. This research also has implications for litigation and policy efforts in other states. This research should be replicated in other states, to determine whether the observed patterns are similar or different. These findings suggest that it is important to pay attention not only to statewide sentencing rules, but how local decisionmakers, and in particular prosecutors, implement these rules. First, we discuss what implications this work has for prosecutorial discretion, race, and crime rates. Second,

we discuss state and federal constitutional implications. Third, we discuss implications for patterns in the imposition of life and death sentences.

A. Prosecutors, Race, and Crime Rates

Though LWOP was adopted in an effort to respond to rising crime rates, with more retributive sentencing options, we find that in practice, LWOP sentencing is not responsive to crime rates.¹⁴⁶ In particular, we observe that the results from each model imply there is a *negative* correlation between the homicide rate in a county and the number of LWOP sentences we observe in that county. This finding is easily observe just from our descriptive data. After rising in the 1990s, LWOP sentencing has remained steady in North Carolina, even as homicide rates have fallen. The descriptive data is puzzling, however, because prosecutors retain great discretion whether to seek LWOP sentences. One might expect prosecutors to be responsive to crime rates and incidence in a county, but instead we find that factors other than homicide rates correlate with LWOP sentencing.

One explanation for geographic variation in LWOP sentences may be pleabargaining dynamics. As previously described, the broad definition of first-degree murder requires prosecutors to make judgments during plea bargaining that may vary in each case. Plea bargaining may depend on the defendant's desire to avoid a death sentence, or conversely on the defendant's belief that they can obtain a conviction for a lesser offense than first-degree murder, such as a second-degree or manslaughter conviction. Thus, prosecutors' varying approaches to plea bargaining and the threat to the defendant of a death sentence or LWOP sentence may influence defense lawyers practicing in a particular geographic area and the subsequent sentences imposed on their clients.

The path dependency that we observe in LWOP sentencing practices may reflect these plea bargaining dynamics over time. In addition, inertia effects may also arise from prosecutorial discretion. Prosecutors may have different policies regarding when they seek a death sentence or when they seek a first-degree homicide sentence that would result in LWOP.

Still more troubling, the results of this study also imply that LWOP sentencing is not just driven by past LWOP sentencing practices, but also by the homicide rate within the Black population of a county. This correlation is not, however, statistically related to the homicide rate within the White population of a county. We also observe that increased LWOP sentencing is associated with a greater White population in a county. This may represent, as we noted, a race-of-victim effect, although we also note that results these were not consistent across models. It may be that murders involving White victims explain county-level LWOP sentencing patterns better than murders involving Black victims.

¹⁴⁶ While these results are consistent with analysis of death sentencing from 1991-2017, *see* Garrett et al., *supra* note 24, at 569–70, they are inconsistent with one study examining death sentencing from 1976-2001. Eisenberg, *supra* note 140, at 354–55 (finding a statistically significant direct relationship between murder rates and death sentences).

A race-of-victim effect has been widely documented in studies of death sentencing, together with geographic disparities.¹⁴⁷ Specifically, the death penalty is sought significantly more often in homicides when the victim is White compared to when the victim is Black. This holds true when accounting for the number of aggravating factors and culpability.¹⁴⁸

That the same pattern may be observed in LWOP sentencing adds still more concern regarding race-of-victim bias in the manner in which severe sentences are imposed. That said, state-level patterns vary considerably in death sentencing research, and they may similarly do so in LWOP outcomes.¹⁴⁹ Thus, researchers should study LWOP sentencing data in other states.

Prior research on death sentencing nationally shows strong inertia effects. However, that inertia may reflect decisions of judges and jurors, and not just prosecutorial discretion. Similarly, researchers have observed findings of inertia in juvenile LWOP sentencing.¹⁵⁰ We did not, however, observe the same results in adult LWOP sentencing. In contrast to death sentencing and juvenile LWOP sentencing, for which limited aggravating factors must now be present in order to sentence, adult LWOP sentencing is more broadly available in first-degree murder cases. Nevertheless, we did observe great differences in the concentration of LWOP sentences, with some districts imposing far greater numbers of such sentences.

B. State and Federal Constitutional Implications

A second question is whether courts will act to remedy the observed disparities. State courts may be more hospitable to challenges making use of such data than federal courts. The observed racial disparities, together with inertia effects driving LWOP sentencing outcomes, could also be addressed by legislation like the now-repealed Racial Justice Act in North Carolina, in which disparate impacts can be studied and remedied.¹⁵¹

¹⁴⁷ See U.S. GEN. ACCT. OFF., DEATH PENALTY SENTENCING: RESEARCH INDICATES PATTERN OF RACIAL DISPARITIES 5–6 (1990) (finding race of victim disparities in analysis of 28 capital charging and sentencing studies); see also Catherine M. Grosso et al., Race Discrimination and the Death Penalty: An Empirical and Legal Overview, in AMERICA'S EXPERIMENT WITH CAPITAL PUNISHMENT 525, 525 (James Acker & Robert Bohm eds., 2014) (reviewing the literature up to 2013); DAVID C. ¹⁴⁸ See O'Brien et al., *supra* note 140, at 2023, 2025 (finding that "white victim cases are 3.3 times more likely (8.6%/3.4%) to receive a death sentence than black victim cases" and that after controlling for aggravating evidence, "[t]he selection rates by race of victim in Column E document that white victim cases are more likely to receive a death sentence *at every level* of aggravation.") (emphasis in original).

¹⁴⁹ See Garrett et al., supra note 24, at 570.

¹⁵⁰ See Finholt et al., supra note 25, at 165.

¹⁵¹ N.C. GEN STAT. § 15A-2011(b), 2012(a)(3) (repealed 2013) (providing that a person sentenced to death "may seek relief . . . upon the ground that racial considerations played a significant part in the

Federal courts are not likely to carefully scrutinize patterns in LWOP sentencing, even if the exhibit racial disparities. In the death penalty context, the U.S. Supreme Court in *McCleskey v. Kemp*¹⁵² rejected constitutional claims raised to challenge race-of-victim effects in death sentencing.¹⁵³ Because such challenges did not succeed in the death penalty context, they are less likely to succeed in the adult LWOP context. To be sure, Justice Breyer, in his opinion in *Glossip v. Gross*,¹⁵⁴ took account of geographic disparities in death sentences.¹⁵⁵ However, Justice Breyer was writing in dissent, and that opinion also emphasized how rare death sentences have become, and how concentrated they have become in a narrow group of counties.¹⁵⁶ While LWOP sentences are concentrated and imposed more frequently in some counties, they are generally far more common than death sentences. Regardless, Justice Breyer's approach towards closer examination of county-level sentencing patterns does not appear likely to garner a majority of the Justices in the death penalty context, much less other sentencing contexts.

State courts may be more amenable to such claims. State courts, in the death penalty context, however, have followed Justice Breyer's approach and examined geographic disparities and race disparities in death sentencing patterns.¹⁵⁷ Further research should examine whether similar patterns in LWOP sentencing can be observed in other states, in order to improve our understanding of these sentencing practices, and to potentially inform litigation and policy.

Empirical data concerning LWOP sentencing may inform more specific challenges to types of LWOP sentences, rather than challenges to the entire enterprise. In its death sentencing rulings, an important focus of the Court has been on the direction of change, as states have ended death sentencing practices.¹⁵⁸ Proponents of sentencing reform, then, might first focus on challenges to particular LWOP sentencing practices, beyond juvenile cases, such as LWOP for non-murder offenses. At least in North Carolina, the bulk of adult LWOP sentences are for first-degree homicide. Thus, the most appropriate challenges to adult LWOP sentences might be to challenge their mandatory imposition, or their application to mentally ill or intellectually disabled populations, or the subject involving felony murder theories. Furthermore, it is likely that legislative efforts addressing the cost savings and limited benefits of lengthy sentences may be more promising than constitutional litigation.

decision to seek or impose a death sentence" and that statistical evidence can be used to support such claims).

¹⁵⁸ Roper v. Simmons, 543 U.S. 551, 567 (2005) (noting "consistency in the trend toward abolition of [the juvenile death penalty]" in the states).

State court challenges to LWOP sentencing could be brought under North Carolina's equal protection clause.¹⁵⁹ In addition, there is a separate nondiscrimination clause in the North Carolina Constitution.¹⁶⁰ The nondiscrimination clause has not been interpreted by the North Carolina Supreme Court or North Carolina Court of Appeals.¹⁶¹ However, we do know that the clause was the product of the North Carolina Constitutional Study Commission in 1968-69, an era in which there were several high-profile Civil Rights Act decisions in North Carolina.¹⁶² The Study Commission Report suggests that the legislature intended this supplementary protection, in addition to equal protection, providing "a prohibition of improper discrimination by the State."163 The nondiscrimination clause, since it was added to supplement the preexisting equal protection clause, appears to "[do] more than protect individuals from unequal treatment."¹⁶⁴ Perhaps like the Civil Rights Act of 1964, it prevents practices that invidiously discriminate on the basis of race even in the absence of a specific intent to discriminate.¹⁶⁵

Another way to address LWOP sentences individually in North Carolina, could be through Consent Motions for Appropriate Relief ("MARs"), in which the parties agree that the sentence was extreme or would not be imposed today. In 2012, lawmakers enacted a provision which permits parties to enter into an agreement regarding "any aspect, procedural or otherwise" of a motion for appropriate relief.¹⁶⁶ This allows a MAR on any grounds and at any time, if both parties consent.¹⁶⁷ However, if LWOP sentences truly reflect current prosecution priorities, then both parties may not be open to joining such motions to revisit sentences in the past. During the COVID-19 pandemic, there were efforts in North Carolina, as in many states, to reconsider lengthy sentences in order to reduce prison populations, including through the use of MAR motions.¹⁶⁸ To date, a number of such motions have

proceeded, and resulted in release, in North Carolina.¹⁶⁹ The general research in this Article, however, could support the consideration of such MARs in individual cases, or the use of analogous resentencing mechanisms in other states.

C. Death Sentencing and Life Sentencing

Beginning in the 1970s, concerns about the constitutionality of the death penalty led to adoption of LWOP statutes as an alternative. More recently, strict sentencing laws led to LWOP adoption more broadly across the country. In North Carolina, LWOP was adopted both as part of a statute eliminating parole, and as an alternative to the death penalty. In practice, as described in Part II, in the bulk of cases in which LWOP has been imposed, it has been in first-degree homicide cases. That said, not all first-degree murder cases can result in the death penalty; not only must aggravating factors be present, but juveniles and intellectually disabled individuals may not be sentenced to death. The relationship between the death penalty and LWOP has not been closely examined empirically.¹⁷⁰ There is a far larger body of research on death sentencing, and studies of LWOP are few. We find that trends in death and LWOP sentencing do not track each other. Prosecutors increasingly do not seek or obtain death sentences in states like North Carolina, while LWOP sentencing has remained more stable or even increased. We also observe that death sentencing and life sentencing separately exhibit inertia, meaning that counties with prior LWOP sentences experience more LWOP sentences in the future. Again, further research is needed across states to better understand these trends. These findings suggest, though, that at the local level, LWOP sentencing has increased substantially.

Conclusion

During a time in which homicide rates continue to fall, and death sentences plummet, LWOP sentencing persists at record levels. Although research has examined drivers of incarceration generally, and death sentencing specifically, there has been little research on LWOP sentences, despite their growing prominence. We examined the characteristics of the 1,627 LWOP sentences imposed in North Carolina from 1995 to 2017. We analyzed defendant race, crime, and sentence patterns by county. We associated LWOP with homicide rates, by county, and examined interactions between homicide, victim race, and prior LWOP sentencing.

This empirical analysis of adult LWOP sentences suggests that even for a penalty that can be mandatory (for first-degree homicides) there are important variations in its imposition. We do not find positive correlations with homicide rates. Instead, most notably, we find strong county-level inertia effects, suggesting that

¹⁷⁰ One exception is the examination of the relationship between death sentencing and state-level adoption of LWOP. *See* Garrett et al., supra note 24, at 569–70.

path dependency in local prosecution practices affects LWOP sentencing. We find that fewer LWOP sentences are predicted to occur as the number of Black victim homicides increase in a county, but no such relationship is found when considering the number of White victim homicides. We also find that less densely populated and more rural counties are more likely to impose LWOP sentences than urban counties.

While the U.S. Supreme Court has not regulated adult LWOP under the Eighth Amendment, this evidence begins to make the case that there are important arbitrariness and bias concerns in adult LWOP sentencing, as with juvenile LWOP. Further research should examine whether similar patterns in LWOP sentencing can be observed in other states. These findings suggest that state legislative interventions do not always have uniform effects. These findings also suggest that local patterns in sentencing will be important subjects for future research and policy. Far more attention is due to LWOP sentences, which persist at record-levels despite a continued decline in homicide rates, likely because of stark differences in exercise of prosecutorial. These findings have implications for efforts to reconsider the most severe sentences in the U.S., beginning with LWOP sentences.

In many other countries, LWOP sentencing has been barred, having been the subject of substantial human rights concerns since, like death sentences, LWOP sentences do not permit the possibility of review or relief based on rehabilitation.¹⁷¹ The U.S. is bucking a global trend in the increasing use of LWOP sentences, doubling down on a practice that implicates grave human rights concerns, even as crime and homicide rates have generally declined. This North Carolina study suggests that LWOP sentences reflect not national or state, but chiefly local preferences as well as preferences for severe sentences in cases with White victims, rather than a consistent response to crime rates. That such severe sentences can flow from local preferences, even if one puts to one side their human rights and dignitary costs, where they bring equivocal benefits to public safety. More broadly, far more work must be done to examine the consequences of our growing and aging population of life and long-term prisoners.¹⁷² We hope this Article provides an empirical foundation for a more systematic re-examination of LWOP in the United States.

¹⁷¹ Vinter, Eur. Ct. H.R. 54 (Power-Forde, J., concurring) (holding that a life sentence that is irreducible violates ECHR Article 3, and that such a sentence must offer a prospect of release and possibility of review).

Appendix A: Prosecutorial Districts

In addition to the county-level data analysis, we attempted to analyze prosecutor district-level data as well. In North Carolina, there are currently 43 prosecutor districts, but, depending on the year, that number fluctuates. Since 1990, the prosecutor district map has changed many times.¹⁷³ In order to obtain districtlevel data throughout this time period, data for each county belonging to a district during a particular year from 1995 to 2017 was aggregated. For some of the independent variables, this was a straightforward process. For example, the number of LWOP sentences and the number of death sentences were simply summed across counties for each district for each year. However, to calculate the overall homicide rate, the white homicide rate, the black homicide rate, and the poverty rate for each district and year required a series of steps. The first step required calculating the raw number of homicides, the number of white homicides, the number of black homicides, and the number of those in poverty for each county belonging to a particular district in a particular year. Those numbers were then summed and that sum was divided by the total population in that district. These rates were then transformed into a rate per 100,000 inhabitants. The proportion of the population that is black required calculating the number of black inhabitants for each county in each district and dividing that number by the total population of the district. Other independent variables such as population density and racial fragmentation were not calculated at the district-level because it was not feasible to calculate. In total, the district-level data resulted in 1,506 observations under this arrangement.

 $^{^{173}}$ For the current districts, see e.g., N.C. Gen. Stat. § 7A-60 (2019).

Table A1: Prosecutorial District Poisson Regression Results for Adult LWOPSentences (1995-2017)

	Model 4			Model 5	Model 6	
Predictors	4A	4B	4C		6A	6B
Homicides per 100k^	0.09			0.09	0.03	0.05
Black Homicides per 100k [^]		0.14				
White Homicides per 100k^			0.01			
% in Poverty^	-0.03	-0.03	-0.03	-0.06	-0.04	-0.04
% Population Black^				0.04		
# LWOP Sentences in prior year					0.05 ***	
# Death Sentences in prior year						0.03
Intercept	-0.54 *	-0.52 *	-0.53 **	-0.55 *	-0.53 *	-0.49 *
Observations	1506	1506	1506	1506	1506	1506
District Fixed Effects	Yes	Yes	Yes	Yes	Yes	Yes
AIC	4552.8	4547.3	4555.4	4554.4	4227.2	4244.4

Note: ^ indicates values were centered and scaled prior to running the regression. Values were scaled so that the distribution of values had a mean equal to zero and a standard deviation equal to one. AIC for the best fitting model is shown in bold. p<0.1; **p<0.05; ***p<0.001

The dependent variable for these regression analyses is the frequency of LWOP sentences within each district for each year (see Figure 5B). Approximately 31% of the time, there were zero LWOP sentences in a given district for a given year. This percentage is far lower than what was observed for the county-level analyses. This is because districts aggregate the frequency of LWOP sentences across multiple counties, making it more likely that a district in a particular year observes at least one LWOP sentence. The dependent variable has a mean value of 1.79 and a standard deviation of 2.05. Once again, a Poisson regression was considered to be the appropriate regression model given the dependent variable is a count variable and the data are not overly-dispersed.

Each continuous independent variable was centered and scaled to have a mean of 0 with a standard deviation of 1 before running the Poisson regressions. The district-level results of a set of Poisson regressions are presented in Table A1.

1. Homicide Rates

Models 4, 5, and 6 in Table A1 yield no significant relationship between homicide rate and adult LWOP sentences. This remains true even when we examine the race of the victim by considering the black-victim homicide rate in a district (model 4B) and the white-victim homicide rate in a district (model 4C).

2. Race and LWOP Sentencing

Model 5 in Table A1 yields no significant relationship between the black population percentage in a district and the number of LWOP sentences observed in that district.

3. Death Sentencing

Model 6B in Table A1 yields no statistically significant relationship between the number of previous death sentences within a prosecutor district and the number of LWOP sentences observed in that district. This is consistent with the county-level regressions that we reported previously.

4. The Inertia Effect

Model 6A in Table A1 yields a highly significant, positive relationship between the number of LWOP sentences occurring in the district's prior year and the number of LWOP sentences occurring in the district's current year. This finding is yet another example of the inertia effect and replicates the county-level analyses.

Appendix B: LWOP Sentences in North Carolina

The table below presents the number of LWOP sentences per county, the number of death penalty sentences, the county population size (based on 2010 Census), and the black population share (based on 2010 Census).

Table A2. North Carolina County LWOP Data (1995 – 2017)

County	LWOP Count	Population Size (in 2010)	Death Penalty Count	Black Population Share (in 2010)
